

Title: Building the green future: European collaboration towards an inclusive, human-centric and sustainable built environment

How will we live in a climate-neutral future? That is what the New European Bauhaus initiative and the Built4People partnership are aiming to find solutions for. Solutions that are scientifically, socially, and economically innovative, sustainable and inclusive, with a design that is geared towards human well-being and health.

The Oslo region is the most densely populated region in Norway, and it is a region with high climate targets. Implementing the green transition in the built environment then naturally has a high priority. With strong R&I environments within carbon positive construction, energy efficiency technology, and fossil-free construction sites amongst other areas, our region is well equipped to collaborate, share knowledge, and learn from European peers.

Join the event at Nordic House on the 8 June for an update on the latest developments and project opportunities connected to the green transition in the European built environment sector, and for an opportunity to meet and exchange on activities and ambitions!

You can register by Friday 3 June at this [link](#).
